

## The Fender Rack

### The Fender Bike Rack for Bikes with Fenders

Combining all the design benefits of our Classic Rack, our Fender Bike Rack accommodates bikes with fenders or mudguards. Now you can safely and securely store your bike without any heavy lifting and maximize your storage efficiency with the Steadyrack Fender Rack.

If you have an aero or a time trial bike, then the Steadyrack Fender Rack is the right storage product for your bike. These types of bikes usually have a very small gap between the front tire and the down tube. Thanks to the innovative saddle rest on the Fender Rack, the rack can slide easily in between this tight gap to cradle your valuable bike by its tire, not the frame.

**Some bikes with fenders may not be suitable for this bike rack.**

The Steadyrack Fender rack works by sliding between the fender/mudguard and tire when rolling the bike onto the rack. If the stays (steel arms connecting the fender to the bike frame) are very close to the tire or rigid with no flexibility there may not be room to fit the rack arms between and you will not be able to mount the bike in the rack.

When it comes to bike fenders and racks, we recommend a minimum 3/4 inch clearance between the tire and stays to enable the rack to flex and fit between.

Be sure to check the length of the back fender or mudguard to ensure you can raise the bike onto the rear tire enough to roll it in and out of the rack without the fender scraping it on the floor!

Our fender saddles are made from a high quality Nylon material, which allows them to be both flexible enough to hug your tyre, and strong enough to easily hold 35kg. Rest assured, it will cradle your bike for years to come.
